

# E36 Mx Series Coil Cover Installation

Coil cover to suit BMW M5x Engines (M50,M52, M54 etc)

This is a thin stainless steel heat shield in a half cover design to keep high radiant heat away. Keeping the valve cover, gasket, harness and coils safe. Heat can escape from top edge. This also allows it to be fitted to both the M50 M52 series of motors without modification.

Made from RAW 1mm Stainless Steel with no coating. Remove protective plastic before use.

The Coil cover can be mounted in various ways to suit different applications. Below we show the most common way people have mounted our cover.

## Step 1

## Step 2

Using the supplied M6 Bolts or your own M6 bolts fit them with some vacuum hose to the cover as shown below. This will allow you to space the cover to your desired height for each specific application and dampen any noise produced by vibration from the engine.

## Step 3

Tighten M6 bolts into the threads you removed the OEM mounting grommets from and you're done!
